Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

useful for synthesising sialylated oligosaccharide such as ganglioside; lysoganglioside or their mimics. Glycosyltransferases are useful for chemo-enzymentic synthesis of oligosaccharides are useful for chemo-enzymentic synthesis of oligosaccharides are useful for chemo-enzymentic synthesis of oligosaccharides and corter oligosaccharides that have blological activity. The enzymes and nucleic acide that encode them are useful for studies of the pathogenesis mechanisms of organisms that synthesize ganglioside mimics, such as C.C. genes involved in ganglioside mimetic synthesis. Antibodies raised against the glycosyltransferases are also useful for analyzing the captession patterns of these genes involved in pathogenesis. The nucleic acids are also useful for designing antisense oligonucleotides for inhibiting expression of the Campylobacter enzymes that are involved in the biosynthesis of ganglioside mimics that can mask the pathogens from the biosynthesis of ganglioside mimics are useful as diagnosing reagents or as therapeutics and as immunogens for producing antibodies. Bacterial glycosyltransferase can be used to catalyse the formation of cligosaccharides that are identical to the corresponding mammalian structures and are easier and less expensive to produce in large quantity, compared to the mammalian glycosyltransferase. The bacterial cripm of the enzymes facilitates expression of large quantities of the enzymes using relatively inexpensive prokaryotic expression systems.

                                                                                                                                                                                                                                                                                                                            8
                                                                                                         The invention comprises the amino acid and coding sequences of campylobacter jejuni proteins. The C. jejuni proteins of the invention campylobacter jejuni proteins. The C. jejuni proteins of the invention come way be either an: acyltransferase; glycosyltransferase; GalNAc (N-Acetylgalactosmaine) transferase; glactosyltransferase; GalNAc (N-Saialyltransferase; sialic acid synthase; cytidine 5'-monophosphate (CMP) sialyltransferase; sialic acid synthase; cytidine 5'-monophosphate (CMP) sialic acid synthetase; acetyltransferase. The C. jejuni DNA and protein sequences of the invention are useful for ganglioside synthesis, studying CC ganglioside mimetics, and for designing oligonucleotides to inhibit expression of Campylobacter enzymes involved in the biosynthesis of ganglioside mimetics that can mask the pathogen's from the host's immune CC ganglioside mimetics that can mask the pathogen's from the host's immune CC ganglioside mimetics that can mask the pathogen's from the host's immune CC diagnostic reagents (e.g. to locate areas of inflammation or tumour metastasis). The present DNA sequence represents a Campylobacter jejunicate invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TTTGATGTATTTAGATGTAATCAATTTTATTTTGAAGATAAATACTATCTTGGTAAAAA 132

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       useful for synthesising siallylated oligosaccharide such as ganglioside, lysoganglioside or their mimics. Glycosyltransferases are useful for chemo-enzymatic synthesis of oligosaccharides are useful for chemo-enzymatic synthesis of oligosaccharides and corber oligosaccharides them are useful for studies of the enzymes and nucleic acids that encode them are useful for studies of the pathogenesis mechanisms of organisms that synthesize ganglioside mimics, such as C. joinni and the nucleic acids are used as probes to study expression of genes involved in ganglioside mimetic synthesis. Antibodies raised against the glycosyltransferases are also useful for analyzing the expression patterns of these genes involved in pathogenesis. The nucleic acids are also useful for designing antisense oligonucleotides for inhibiting expression of the Campylobacter enzymes that are involved in the biosynthesis of ganglioside mimics that can mask the pathogens from the hosynthesis of ganglioside mimics that can mask the pathogens from the hosy immune system. The oligosaccharides are useful as diagnosing reagents or as therapeutics and as immunogens for producing antibodies. Bacterial glycosyltransferase can be used to catalyse the formation of oligosaccharides that are identical to the corresponding mammalian entities and as and less expensive to produce in large.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A reaction mixture for the synthesis of a sialylated oligosaccharide is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       quantity, compared to the mammalian glycosyltransferase. The bacterial origin of the enzymes facilitates expression of large quantities of the enzymes using relatively inexpensive prokaryotic expression systems.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention comprises the amino acid and coding sequences of Campylobacter jejuni proteins. The C. jejuni proteins of the invention may be either an acytransferase; glycosytransferase; GalNAc (N-Acetylgalactosamine) transferase; galactosyltransferase; sialic acid synthase; cytidine 5'-monophosphate (CMP) sialic acid synthetase; acetyltransferase. The C. jejuni DNA and protein sequences of the invention are useful for ganglioside synthesis, studying ganglioside mimetics, and for designing oligonucleotides to inhibit expression of Campylobacter enzymes involved in the biosynthesis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            108 GlyHisGluIleIleLysLysLeuLysAspPhePheAlaTyrIleLysTyrAsnGluIle 127
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             88 TyrileAspGlyPheGlnPheValAspAsnPheGluLeuTyrPheSerAspAlaPheLeu 107

for

6; Page 94; 120pp; English Claim

A reaction mixture for the synthesis of a sialylated oligosaccharide is useful for synthesising sialylated oligosaccharide such as ganglioside, lysoganglioside or their mimics. Glycosyltransferases are useful for chemo-enzymatic synthesis of oligosaccharides, including gangliosides and chemo-enzymatic synthesis of oligosaccharides, including gangliosides and cuter oligosaccharides that encode them are useful for studies of the pathogenesis mechanisms that encode them are useful for studies of the pathogenesis mechanisms of organisms that synthesize ganglioside mimics, such as C. jejuni and the nucleic acids are used as probes to study expression of genes involved in ganglioside mimetic synthesis. Antibodies ratised against the glycosyltransferases are also useful for analyzing the expression patterns of these genes involved in pathogenesis. The nucleic caids are also useful for designing antisense oligonucleotides from inhibiting expression of the Campylobacter enzymes that are involved in pathogens from the biosynthesis of ganglioside mimics that can mask the pathogens from the biosynthesis of ganglioside mimics that can mask the formation of reagents or as therapeutics and as immunogens for producing mammalian carretures and are easier and less expensive to producing mammalian carretures and are easier and less expensive to produce in large contain of the enzymes facilities expression of large quantity, compared to the mammalian glycosyltransferase can be carrely equantities of the corresponding mammalian corregion corregion of the using relatively inexpensive prokaryotic expression systems (Updated on 15-SEP-2003 to standardise OS field) enzymes

The invention comprises the amino acid and coding sequences of Campylobacter jejuni proteins. The C. jejuni proteins of the invention Claim 8; Page 97; 107pp; English

```
may be either an: acyltransferase; glycosyltransferase; GalNAc (N-Acetylgalactosamine) transferase; galactosyltransferase; siallyltransferase; siallyltransferase; siallyltransferase; siallyltransferase; schollage of spanson spanson siallo acid synthetase; acetyltransferase. The C. jejuni DNA and protein sequences of the invention are useful for ganglioside synthesis, studying spanslioside mimetics, and for designing oligonacleotides to inhibit expression of Campylobacter enzymes involved in the biosynthesis of ganglioside mimetics that can mask the pathogen's from the host's immune system. The C. jejuni oligosaccharides of the invention may be used as diagnostic reagents (e.g. to locate areas of inflammation or tumour metastusis). The present DNA sequence represents a Campylobacter jejuni gene of the invention

useful for synthesising stalylated oligosaccharide such as ganglioside, lysoganglioside or their mimics. Glycosyltransferaces are useful for chemo-enzymatic synthesis of oligosaccharides, including gangliosides and other oligosaccharides that have biological activity. The enzymes and nucleic acids that encode them are useful for studies of the pathogenesis mechanisms of organisms that synthesize ganglioside mimics, such as C. jejuni and the nucleic acids are used as probes to study expression of genes involved in ganglioside mimeric synthesis. Antibodies raised against the glycosyltransferases are also useful for analyzing the expression patterns of these genes involved in pathogenesis. The nucleic acids are also useful for designing antisense oligonucleotides for inhibiting expression of the Campylobacter nazymes that are involved in the biosynthesis of ganglioside mimics that can mask the pathogens from the bosynthesis of ganglioside mimics that can mask the pathogens from the bost's immune system. The oligosaccharides are useful as diagnosing
